Digital Retinal Photography

Many health professionals use MRI’s, Xrays, ultrasounds, and mammograms to aid in diagnosing health conditions. Our practice provides a comparable level of quality care with digital retinal screening photos. The photo is quick, easy, painless, and allows a detailed view of the inner lining of the eye often without the need of dilation.

*We recommend a baseline photo for every patient (under age 30) and yearly screening photos after that age.

**We strongly recommend a screening photo for patients with a personal or family history of high blood pressure, diabetes, macular degeneration, glaucoma, floaters, retinal holes or detachments.

The Benefits:

- An enhanced, high resolution digital image of the optic nerve, macula, blood vessels, and inner lining of the eye.

- The image becomes part of your permanent medical record allowing us to compare any changes occurring in the eyes.

- The screening photo aids in early diagnosis of many eye conditions and systemic health conditions like; high cholesterol, high blood pressure, diabetes, macular degeneration, glaucoma., and retinal tumors.

Generally, your insurance does not cover preventative health screenings like digital retinal photography. You will be responsible for the $25 fee.
